**Ultrasound Guidance – Selected Indications - Medical**

Thoracic paravertebral block (TPVB) is the technique of injecting local anesthetic alongside the thoracic vertebra close to where the spinal nerves emerge from the intervertebral foramen. This produces unilateral, segmental, somatic, and sympathetic nerve blockade, which is effective for anesthesia and in treating acute and chronic pain of unilateral origin from the chest and …

The Medical Services Advisory Committee (MSAC) is an independent non-statutory committee established by the Australian Government Minister for Health in 1998.

Management of acute perioperative pain - UpToDate

Ultrasound-guided sciatic block – For an ultrasound-guided sciatic block, the ultrasound transducer is held transverse to the course of the nerve. The sciatic nerve can be blocked via a transgluteal (needle inserted just distal and deep to gluteus maximus muscle) or infragluteal (just below the level of the subgluteal crease) approach.

MSAC - Medical Services Advisory Committee

Ultrasound-guided sciatic block – For an ultrasound-guided sciatic block, the ultrasound transducer is held transverse to the course of the nerve. The sciatic nerve can be blocked via a transgluteal (needle inserted just distal and deep to gluteus maximus muscle) or infragluteal (just below the level of the subgluteal crease) approach.

Ultrasound for Regional Anesthesia

Oct 31, 2017 · To perform an ultrasound-guided TAP block, identification of the TAP is a priority. We suggest the scanning steps as follows: (1) Put the transducer transversely just below the xiphoid process and locate the paired rectus abdominis and the linea alba. (2) Rotate the transducer obliquely and move laterally, parallel to the costal margin.
